ABSTRACT

In July 2012 the Chemical Safety Board (CSB) held a two-day forum to discuss the use of process safety indicators both on and offshore. Representatives from various high-hazard industries, the workforce, and national and international regulators spoke on how indicators shape safety performance in technologically complex and hazardous work environments. From its investigative work and the forum discussions, the CSB has identified several key aspects for effective implementation of safety indicators for major accident prevention. This presentation will discuss those key aspects and explore the role of indicators for improved safety management.
